MEMORANDUM

TO: Charles Gazda,
Chief Compliance Section

FROM: David Anderson, FIT Chemist, S.D.
E&E Region VI

THRU: K. Malone, Jr., FITL *km*
E&E Region VI

DATE: October 20, 1981

The purpose of this memorandum is to resolve the conflicts between the attached Preliminary Assessment Reports which were prepared in September, 1980, and September, 1981 respectively. The earlier report was based on a file review while the September, 1981 report was prepared following an on-site reconnaissance inspection. Therefore, information contained in the later report should take precedence over that previously submitted.

The receiving water for the discharge from the Koppers Co. facility is the Houston ship channel. This water is not a desirable domestic raw water supply nor is it desirable for the propagation of fish and wildlife according to the TDMR, April, 1981 water quality standards. All effluent waters are biologically treated before discharge. The biological treatment facility has been in operation for less than one (1) year. The facility has not had problems with their discharge since the treatment facility became operational. Since the discharge is tested monthly by Harris County and no remedial activity has been required, no further action is recommended at this site.
